

Engineering, Inc.

The first name in mixers and dispersers

INCREASED PRODUCTION!

A hoist mounted tank disperser puts the blade at the right level — *always!*

Tank mounted dispersers take up less room, they are safer, and speed production when the same product is made over and over. Now Myers provides a limited lift impeller for a tank mounted disperser. It raises and lowers in the tank. This lets you work closer to the bottom for small batches. It raises to "pull in" materials for faster dispersion on larger batches. Myers two-column hoist reduces the height of the machine and shortens the shaft. This makes the disperser more stable and takes up less space than does a single post unit.
